31 Jul 2014

I am applying for job offer Linux and Mac OS X Developer, published on the job server profesia.sk.

I am convinced that I am a good candidate to the mentioned job position. I have been working as a C++ developer at s-IT solutions, now renamed to Erste Group IT SK, since 2010. Starting on the smaller projects, I have soon gained deeper knowledge of how systems work in the enterprise environment. Later on I have started my own project, to replace existing transfer adapters (similar to the ETL tools) currently used, while starting from the scratch. New transfer adapter is deployed, and is used for most performance critical data transfers. Implementing it, I have gained deep knowledge of low level asynchronous network programming, while retaining high throughput by utilizing multiple threads.

I am improving my knowledge in the field of programming and application development by studying new standards released, and applying it in either work, or personal projects, developed in my free time. I am also subscribed to multiple RSS feeds, which try to uncover many interesting points and features of the C++ language.

I see the possibility to work in your company as opportunity to deepening my knowledge and contribute with my gained experience.

Please see my resume for additional information about my experience. I would welcome the opportunity to discuss my background in greater detail, and look forward to hearing from you.

Sincerely yours,

Tomas Kislan
